

Lecture 14 questions

(These exercises are relevant for chapter 8 in Dierbach)

A1. Save the file "poem.txt" in your working directory. Make a python file where you open the text file and read the contents into a variable called "poem". Use the `.readlines()` method for reading the text file.

A2. Print the contents of poem, line by line.

A3. In A1, you used the `.readlines()` method. What happens if you use the `.readline()` method instead? (Which is without the s on the end)

A4. Open "poem.txt" but use the `read()` method. What is the output like?

A5. Make a new file called "winston.txt". Write the following lines to the file:

Success is not final,
failure is not fatal.
It is the courage to continue that counts.

Open the file to see that you have written the text to the file.

A6. Open "poem.txt" but now you can write two more lines to the poem. Find your inner poet.
